Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Prodn. of polypeptide(s) having monocyte-chemotactic activity - using expression plasmids with E. coli elements and specific E.coli strains

Claim 1; Page 48 + Page 36; 56pp; English.

An expression plasmid, pHM483, for producing MCF(76) consisting of 76 amino acids was constructed. The prod. can be used for e.g. treating bacterial infectious diseases. (Updated on 25-MAR-2003 to correct PN field.)

The present sequence represents a chemokine receptor ligand. The present ligand can be incorporated into the conjugates of the invention. The specification describes a conjugate, computaing a targeted agent and a chemokine receptor ligand. The conjugate binds to a chemokine receptor resulting in internalisation of the targeted agent in cells bearing the receptor. The conjugates are used for formulating a medicament or for treating disorders associated with inflammatory responses resulting from activation, proliferation and migration of immune effector cells. The disorders or disease states comprise secondary tissue damage such as central nervous system (CNS) injury, CNS inflammatory diseases, neurodegenerative disorders, heart disease, inflammatory edgeseses, inflammatory bind diseases, inflammatory has thyroiditis, or cytokine-
     immune effector cell;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 QPDAINAPVTCCYNFTNRKISVQRLASYRRITSSKCPKEAVIFKTIVAKEICADPKQKWV 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   comprising a growth factor, comprises a monocyte chemotactic activating factor (MCAE) or its variants or derivatives. The factor has potent effect on skin wounds and ulcers. The present sequence is human MCAE, the activity of which is exemplified as the new remedy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a new remedy for curing wounds which, instead of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, chemokine receptor modulator; chemokine; HIV infection; AIDS; asthma; allergic rhinitis; atopic dermatitis; atheroma; antimilammatory; antiasthematic; antiallergic, dermatological; antiarteriosclerotic; antirthritic; anti-HIV; immunosuppressive; MCP-1; atherosclerosis; organ transplant rejection; rheumatoid arthritis.
                                                                                                                                                                                                                                                                   The invention relates to polymer-modified bioactive synthetic chemokines and to methods for their production and use. The compounds and methods of the backbone of the invention are useful in the analysis and treatment of various diseases states e.g. HIV and AIDS related disorders, asthma, allergic rhinitis, atopic dermatitis, atheroma/atherosclerosis, organ transplant rejection, and rheumatoid arthritis. This sequence represents the human chemokine MCP-1 protein of the invention
immunosuppressive; polymer-modified bioactive synthetic chemokine; HIV; AIDS; asthma; allergic rhinitis; atopic dermatitis; rheumatoid arthritis; atheroma; atherosclerosis; organ transplant rejection; MCP-1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                     The present invention relates to chemokine receptor modulators, which comprise a chemokine polypeptide chain modified at N-terminus with an alliphatic chain and at least one amino acid derivatives and/or modified at its C-terminus with an alliphatic chain or polycyclic. The modulators can be used to treat diseases such as HIV infection, AIDS, asthma, allergic rhinitis, atopic dermatitis, atheroma, atherosclerosis, organ transplant rejection and rheumatoid arthritis. The present sequence is the human MCP-1 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, monocyte chemoattractant protein-1, MCP-1, C-C chemokine family; pulmonary hypertension; primary; hypotensive.

New antagonists of MCP proteins, useful in preparing a composition for treating or preventing diseases related to excessive leukocyte migration and activation e.g. vascular, inflammatory or autoimmune disease, cancer or infection. Example 3; SEQ ID NO 4; 63pp; English.

The invention relates to novel antagonists of MCP proteins comprising mutants of MCP proteins in which the following combinations of residues, numbered on the sequence of human mature MCP-1, are substituted to Alanine, Glycine, Serine, Threonine, Proline, Aspartic Acid, Asparagine,

of a medical device implanted within a portion of a living body comprising contacting a portion of the living body in contact with the device with a monocyte chemoattractant protein 1 (MCP-1) antagonist to inhibit chronic inflammation induced by the presence of the medical device or fibrous encapsulation of the medical device. The method is useful for enhancing the biocompatibility of a medical device implanted in a portion of a living body by inhibiting chronic inflammation or

The invention describes a method of enhancing (MI) the biocompatibility

Glutamic Acid or Glutamine: 18 and 19; 18 and/or 19, together with 58; 18 and/or 19, together with 66; 18 and/or 19, together with 66; 18 and/or 19, together with 66; and 18 and/or 19, together with 66; and 66; and in a vacine with 66; and 67. A protein of the invention has immunosuppressive, antiinflammatory, cytostatic, antimicrobial, and vasotropic activity. The protein may have a use in gene therapy, and in a vaccine. The MCP proteins are human MCP-1, human MCP-2, human MCP-3, human MCP-4 or human Botaxin. The MCP antegonists are useful in preparing a composition for treating or preventing diseases distance to excessive leukocyte migration and activation, e.g., vascular disorders, cancer, inflammatory or autoimmune disease or infection. The present sequence is used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a nuclear targeting peptide (ADE80826) comprising a nuclear targeting domain isolated from the C-terminal sequence of the ESkine and PESKY cheenchines. The nuclear targeting domain allows the protein to translocate to the cell nucleus. The nuclear targeting peptide is useful in preparing a medicament for treating cancer, particularly Burkitt's lymphoma or nasopharyngeal carcinoma. The present sequence is a chemokine sequence, used in a sequence alignment in

The invention relates to a novel monocyte chemoattractant protein-1 (MCP-cardiant nucleic acid. A protein of the invention has immunosuppressive, cardiant, neuroprotective, antimicrobial, and cytostatic activity. A polymucleotide of the invention may have a use in gene therapy. The protein, nucleic acid, composition and method are useful for diagnosing or treating a MCP-1 mutein-related condition, e.g. immune, cardiavascular, neurologic or infectious or malignant disorders. The present sequence represents human MCP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     90

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is a human-derived monoyte chemo-attractant peptide (MCP-1) sequence mol. mass of c.a. 8,400 D. MCP-1 can be used for treating infection eg inflammatory disease, or for the control of neoplasms by accumulation of monocytes at the site of the infection. The corresp. DNA is obtd. by chemical synthesis, by screening reverse trascripts of mRNA from purified blood leukcytes or cell cultures of eg U-373 MG or KMG-E. (Note: Revised entry submitted to correct the patent number format of US Government-numbers. For further information please with negoing US granted patent numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            An expression plasmid, pHMC076 for producing MCF(76) consisting of 76 amino acids was constructed. DNA encoding MCF(76) was prepd. using a recombinant plasmid pHMCF7. (Updated on 25-MAR-2003 to correct PN field.)
Plasmid, monocyte chemotactic factor; MCF; translation; termination; terminator; initiation; ribosome binding site; RBS; promoter; tryptophan;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9

monocyte infiltration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a monocyte chemoattractant peptide (MCP) designated MCP-1. MCPs can be isolated from human glioma cell line U-
                                                                                                                                                                                              Purified heparanases, prepared under reducing conditions and activated with transglutaminase, are given in AAR70786-804. Most are prepared by reverse transcription of mRNA from activated human leukocytes, then cloning of the cDNA into pVL1392 bacultovirus vector, and expression in Sf9 cells in the presence of reduced glutathione and dithiothreitol. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                    AAR73914 is the chemokine Human monocyte chemoattractant factor hMCP-1. It contains the meningitis related antigenic sequences (MRHAS) claimed in AAR73895 and AAR73807, which are recognised by a monoclonal antibody from the hybridoma Rubella virus (RV)-1. The claimed MRHAS peptides may be used in immunoassays to diagnose the presence of bacterial and/or viral meningitis agents in a sample, or in prophylactic and therapeutic meningitis Lreatments. The peptides may also be used as vaccines against (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 OPDAINAPVICCYNFINRKISVORLASYRRIISSKCPKEAVIFKTIVAKEICADPKOKWV 60

8 g à 셤 9

human monocytes

```
CC treatment of neoplasms and infections in humans. Short peptides derived from MCPs can be screened to identify those that can bind to the monocyte creeptor without stimulating a chemotactic response. These are copentially useful for treating inflammation associated with monocyte confiltration.

RT "Cloning and expression of rhesus monkey monocytes and basophils

Submitted (ARR-2000) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Chemotactic factor that attracts monocytes and basophils

similarity)

-!- SUBCRILULAR LOCATION: Secreted.

-!- SUBCRILULAR LOCATION: Secreted.

-!- SIMILARITY: Belongs to the intercrine beta (chemokine CC) family.

Purification, sequence analysis, and biological characterization of a second bovine monocyte chemotactic protein-1 (Bo MCP-1B).";

La second bovine monocyte chemotactic factor that attracts monocytes, but not neutrophils. Augments monocyte anti-tumor activity. Also induces the release of geladinase B. This protein can bind heparin.

C.-I. PTM: The N-terminus is blocked.

C.-I. SIMILARITY: Belongs to the intercrine beta (chemokine CC) family. RSP: PISSO0; 118; 11.

                                                                                                                                                                                             -!- SUBUNIT: Monomer.
-!- SUBCELLUAR LOGATION: Secreted.
-!- PTM: O-glycosylated.
-!- SIMILARITY: Belongs to the intercrine beta (chemokine CC) family.
Kwon D., Lee D., Sykes B.D., Kim K.-S.;
Submitted (AUG-1998) to the PDB data bank.
-!- FUNCTION: Chemotactic factor that attracts monocytes and
eosinophils, but not neutrophils. Augments monocyte anti-tumor activity, Also induces the release of gelatinase B. This protein can bind heparin. Binds to CCR1, CCR2 and CCR3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pfam; PF00048; IL8; 1.

- SUBCELLULAR LOCATION. Secreted.

- TISSUE SPECIFICITY: Widely expressed. Found in small intestine, thymus, colon, lung, trachea, stomach and lymph node. Low levels seen in the pulmonary arrery smooth muscle cells.

- INDUCTION: By interleukin-1 and TNF-alpha.

- INDUCTION: By interleukin-1 and ERS-30; METHOD-MALDI; RANGE=22-98.

- IN MASS SPECTROMETRY: MW=876; MW ERR=30; METHOD-MALDI; RANGE=22-98.

                              Partels J.H., Schlueter C., Richter E., Noso N., Christophers E., Schroeder J.-M.; Schlueter C., Richter E., Noso N., Christophers E., Schroeder J.-M.; Achlueter C., Richter E., Noso N., Christophers E., Schroeder J.-M.; Achlueted C. T.-M.; Achlueter clouds and RT-PCR analysis."; Submitted (JUL-1996) to the EMBL/GenBank/DDBJ databases. -: FUNCTION: Chemotactic factor that attracts monocytes, lymphocytes. -: FUNCTION: Chemotactic factor that attracts monocytes, lymphocytes, -: FUNCTION: Chemotactic factor that attracts monocytes, lymphocytes, -: FUNCTION: Exceptors. Plays a role in the accumulation of Leukocytes at both sides of allergic and nonallergic inflammation. May be involved in the recruitment of monocytes into the arterial wall during the disease process of attherosclerosis. May play a role in the monocyte attraction in tissues chronically exposed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SMALL INDUCIBLE CYTOKINE A13, LONG FOF SMALL INDUCTBLE CYTOKINE A13, SHORT FOF PYROLIDONE CARBOXYLIC ACID.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
